During the risk assessment process, it is essential to take into consideration the ACGIH occupational exposure levels for inert particulate not otherwise classified (PNOC respirable fraction: 3 mg/m^3 ; PNOC inhalable fraction: 10 mg/m^3). For values above these limits, use a P type filter, with a class (1, 2 or 3) chosen according to the outcome of the risk assessment.

Gypsum is composed of calcium sulphate (CaSO4). Impurities in gypsum-based products usually involve clays, carbonates or marls, depending on where the mineral is quarried, and these may contain small concentrations of silica (amorphous or crystalline).

Gypsum-based products have a zero or very low silica content and, even if present, the quantities are so low as to not pose a significant health risk.

If dusty or powdery material may be generated when handling gypsum-based products, it is recommended to wear a mask, ensure that the workplace is well ventilated, and use protective gloves and goggles.

8.2. Exposure controls

Provide adequate ventilation. Where reasonably practicable, this should be achieved by the use of local exhaust ventilation and good general extraction.

Eye protection:

Use close fitting safety goggles, don't use eye lens.

Protection for skin:

Use suitable clothing that provides complete protection to the skin according to activity and exposure (EN 14605/EN 13982), e.g. overall, apron, safety shoes, suitable clothing.

Protection for hands:

There is no material or combination of materials for gloves that can guarantee unlimited resistance to any individual chemical or combination of chemicals.

For prolonged or repeated handling, use chemical resistant gloves.

Suitable materials for safety gloves (EN 374/EN 16523); NBR (Nitril rubber): thickness >= 0.4 mm; permeation time >= 480 min.

Date 11/03/2024 Production Name RAPID MAXI S1 EXTRA BIANCO Page n. 4 of 9

FKM (Fluorinated rubber): thickness >= 0.4 mm; permeation time >= 480 min

The choice of suitable gloves does not only depend on the material, but also on other quality characteristics that vary from one manufacturer to another and on the manner and times according to which the mixture is used.

If workers are exposed to concentrations above the exposure limit they must use appropriate, certified respirators.

Particle filter device (EN 143): mask with filter P2.

Use respiratory protection where ventilation is insufficient or exposure is prolonged.

Environmental exposure controls:

See point 6.2

Hygienic and Technical measures

See section 7.

11.2 Information on other hazards

Endocrine disrupting properties:

No endocrine disruptor substances present in concentration >= 0.1%

Information on crystalline silica:

The International Agency for Research on Cancer has declared that crystalline silica inhaled due to occupational exposure may cause lung cancer in humans. It nonetheless underlined that the risk does not pertain to all industrial situations nor all types of crystalline silica. In 2003, the EU Scientific Committee on Occupational Exposure Limit values declared that the main effect on humans of inhalation of respirable crystalline silica dust is silicosis. Sufficient information is available to conclude that the relative risk of lung cancer is higher among persons affected by silicosis. Protection of workers is guaranteed by compliance with current occupational exposure limit values. Workers must also receive suitable training on the appropriate use and handling of the product.
